## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136 (a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 21-52 are rejected under 35 U.S.C. 103(a) as being unpatentable over Partridge et al (US 5339,155) in view of Whittaker et al (US 5,267,019) and Boisdé et al (US 4,820,045).

Partridge et al shows an apparatus and method for measuring a gas in the atmosphere in which the wavelength of a beam of light is scanned across the absorption line of the gas of interest; see column 4, lines 23-26. It is known that such wavelength scanning for such measurements can be obtained by modulating the wavelength of a tunable laser; see Whittaker et al; it would have been obvious to use this known technique for obtaining the scanned beam of Partridge et al.

Partridge shows using an optical fiber (34, shown in figure 5) to direct light to and from a measurement station, and states that this allows the light source and detector to be remote from the measuring area (column 8, lines 16-22).

It is known in the art that, with optical tests using optical fibers to carry light to and from the measuring stations that a single light source and detector can

be used to monitor multiple test areas by multiplexing the light to "look at" different measuring stations at different times. This is shown, for example, by Boisdé et al. It would have been obvious to so multiplex measurements as shown in figure 5 of Partridge to monitor more than one remote area without having to duplicate the entire measuring apparatus.
